Applicant(s)

DAGUM ET AL.

Examiner

Beth Van Doren

Art Unit

3623

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 13 June 2005.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-21 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-21 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date 20050428.
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

DETAILED ACTION

1. The following is a final office action in response to communications received 06/13/05.

Claims 1-21 are pending.

Response to Arguments

2. Applicant's arguments with regards to rejections based on Hillier et al. (*Introduction to Operations Research*) have been fully considered, but they are not persuasive. In the remarks, applicant argues that Hillier et al. does not teach or suggest (1) single-variable analysis in the nonlinear Wyndor Glass example as this example is a multi-variable problem with multivariable techniques, (2) elemental blocks as a function of a single variable, (3) unloading of components from an element in a loading step, and that (4) modifying Hillier et al. to include the inverse Cholesky transformation or to incorporate the elliptical family of distributions would render the prior art unsatisfactory for its intended purpose, there is no suggestion that Hillier et al. needs such modification, and there is no reasonable expectation of success.

In response to argument (1), examiner respectfully disagrees. First, Examiner points out that claims 1, 12, and 21 recite that the invention is an automated method for "optimizing a multivariate representation of resources", "optimizing a multivariate non-linear expected value function", and "optimizing the multivariate amount of refinements", respectively. Examiner points out that multivariate, by well-known definition, means having or involving more than one variable.

Looking at each of the independent claims separately, claim 1 recites the language "as a function of a single variable" and "solving for the maximum of each elemental block over each associated single variable". Examiner points out that this language does not specifically limit the

Art Unit: 3623

claim to single variable analysis, but rather multivariable analysis. First, both the loading and re-loading steps recite “as a function of a single variable”, thus stating that each step involves a different and separate variable (i.e. two variables). The use of at least two variables is further supported by the language of the solving step, which states solving each block over each single variable (i.e. each requires more than one). Therefore, it is unclear, based on claim 1 and applicant’s arguments, as to why the Applicant has argued against a multivariable problem with multivariable techniques.

Examiner further points out that claims 12 and 21 do not recite anything concerning a single variable (i.e. where claim 1 recites “as a function of a single variable”, claims 12 and 21 contain no such language). Therefore, again, claims 12 and 21 do not require single variable analysis.

Even if the claims did involve a single variable problem, Examiner points out that page 563 of Hillier et al. specifically recites “When a non-linear programming problem has just one or two variables, it can be represented graphically much like the Wyndor Glass Co. example” and “to highlight the differences between linear and non-linear programming, we shall use some nonlinear variations of the Wyndor Glass Co. Problem”. Further, Applicant admits on page 10 of the response that “The section of Hillier cited by the Examiner mentions the concept of single-variable equations, Hillier at 565, in a side discussion on local and global maxima”. Examiner does not consider this a side discussion, as she has cited this section and used it the elements of the claims concerning solving for maximums. Examiner is unclear as to why Applicant considers this a side discussion since Hillier states in the pages before that “we shall use some nonlinear variations of the Wyndor Glass Co. Problem”.

In response to argument (2), Examiner respectfully disagrees. First, examiner has discussed the term “single variable” above in response to argument (1). Examiner again points out that this language is only present in independent claim 1. Hillier et al. does discuss elemental blocks as a function of a single variable in pages 564-5, wherein a single variable is used and the equation is loaded with a value for that variable that controls production.

In response to argument (3), Examiner respectfully disagrees. The loading, unloading, and reloading recited in the claims is viewed by the examiner as the iterations involved when solving a non-linear optimization problem. Utilizing the constraints, iterations of different values replacing the variables are performed. See pages 564-5, wherein a single variable is used and the equation is loaded and reloaded with values that control production. The equation is solved with each iteration to determine the outputs.

In response to argument (4), Examiner points out that applicant has argued the three basic requirements to establish a prima facie case of obviousness, stating that the modification of prior art reference would render the prior art unsatisfactory for its intended purpose, that there is no suggestion that prior art needs such modification, and that there is no reasonable expectation of success. However, Applicant has not provided any support or evidence to support these conclusions, and therefore these arguments are unpersuasive.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Art Unit: 3623

Claims 1-10, 12, and 16-21 are rejected under 35 U.S.C. 102(b) as being anticipated by Hillier et al. (*Introduction to Operations Research*).

4. As per claim 1, Hillier et al. teaches a method for optimizing a multivariate representation of resources which are used in producing a set of products, the resources, products and their respective connectivities being represented in a product space plan, the method comprising:

converting a non-linear expected value function associated with the resources and products into a closed form expression (See pages 26-27, which sets up the problem. See pages 559 and 564-5, which discloses a non-linear expected value function that is converted to be solved);

transforming the product space plan into a working transformed space plan, wherein the products are transformed into working elements (See pages 559 and 564-5, which transforms the plan in a working plan, wherein the products become working elements of the objective functions);

performing a load step to form elemental blocks as a function of a single variable with elements being loaded with resources that gate production of the elements (See pages 564-5, wherein a single variable is used and the equation is loaded with a value that controls production. The equation is solved);

performing a re-loading step to form elemental blocks as a function of a single variable with elements being reloaded with resources that gate production of the element (See pages 564-5, wherein a single variable is used and the equation is loaded with another value that controls production. The equation is again solved);

solving for the maximum of each elemental block over each associated single variable, wherein solving is performed by a computer (See pages 564-5 and 606-7, wherein local and global maximums are solved and wherein a computer is used to perform the solving. See also 568-9, which discusses unconstrained optimization); and

determining the optimum level of resources as a function of the solved for maximums (See pages 564-5, wherein the optimal level is determined. See also 568-9, which discusses unconstrained optimization).

5. As per claim 2, Hillier et al. discloses wherein the loading and re-loading steps result in an equilibrium configuration that provides the minimum amount of resources to produce any given amount of products across the whole plan (See pages 564-5, wherein the optimal level is determined. See also 568-9, which discusses unconstrained optimization).

6. As per claim 3, Hillier et al. teaches wherein the loading step further includes:

sequentially looking at each present work element (See pages 564-5, 569, 571, and 577, wherein each work element is considered);

determining if each associated resource gates production of the element (See pages 565, 569, 571, and 577, wherein a determination is made as to if a resource controls the element);

if gating occurs, then unloading the resource from a prior element if so loaded, and loading the resource onto the present element (See pages 565, 569, 571, and 577, wherein if the controlling is not considered positive, a new value is loaded).

7. As per claim 4, Hillier et al. teaches wherein the reloading step further includes:

sequentially looking at each present work element (See pages 564-5, 569, 571, and 577, wherein each work element is considered);

Art Unit: 3623

reloading each unloaded resource back onto the element (See pages 565, 569, 571, and 577, wherein the elements are reloaded);

redetermining if the element is gated by each reloaded resource (See pages 565, 569, 571, and 577, wherein a determination is made as to if a resource controls the element);

if the element is so gated, then merging the elements sharing each gating resource into a common elemental block which is a function of a single variable (See pages 565, 569, 571, and 577, which discloses the graphing and merging of elements).

8. As per claim 5, Hillier et al. teaches wherein step of determining that gating occurs includes calculating a new maximum for the loaded element and determining if any remaining components further gate the maximum (See pages 564-5, which discloses loading elements and determining local and global maximums. These maximums are controlled by inputs. See also 568-9, which discusses unconstrained optimization).

9. As per claim 6, Hillier et al. teaches wherein the step of redetermining that gating occurs includes recalculating a new maximum for the reloaded element and determining if any remaining components further gate the maximum (See pages 564-5, which discloses loading elements and determining local and global maximums. These maximums are controlled by inputs. See also 568-9, which discusses unconstrained optimization).

10. As per claim 7, Hillier et al. discloses wherein the step of merging the elements results in an elemental block that is a sub-plan of the overall plan, but which is a function of a single variable (See pages 563-5, 569, and 571, which discloses merging elements that are a function of a single variable).

Art Unit: 3623

11. As per claim 8, Hillier et al. discloses wherein the merged elements intersect at a common resource in the transformed spaces (See pages 563-4, wherein the elements intersect).

12. As per claim 9, Hillier et al. discloses wherein the expected value function represents a statistical expectation of the value function at a given resource allocation and for a given demand distribution (See at least pages 559 and 564-5, which discloses a non-linear expected value function, wherein the function represents the expectation of a value).

13. As per claim 10, Hillier et al. teaches wherein the transforming step involves taking a transformation of the product space to provide the working transformed space wherein the distribution induced on the resources is transformed into a distribution with zero mean and unit variance (See pages 577-578, which discusses unconstrained optimization where the trial solution is varied by unit until the derivative is essentially zero).

14. As per claim 12, Hillier et al. teaches a method for optimizing a multivariate non-linear expected value function which represents a statistical expectation of the non-linear expected value function at a given component allocation and for a given demand distribution, the method comprising:

forming a plan in the product space associated with the non-linear expected value function which represents products, components, and connectivities therebetween (See pages 9-11, 13, 26-28, and 559, wherein a plan is formed associated with a non-linear EVF);

transforming the product space plan to form a corresponding working space plan, with products corresponding to elements such that the distribution induced on the resources is transformed into a distribution with zero mean and unit variance (See pages 559 and 564-5, which transforms the plan in a working plan, wherein the products become working elements of

Art Unit: 3623

the objective functions. See pages 577-578, which discusses unconstrained optimization where the trial solution is varied by unit until the derivative is essentially zero);

converting the associated expected value function into a closed form expression (See pages 559 and 564-5, which discloses a non-linear expected value function that is converted to be solved);

performing a load step which loads each element with components that gate production of the element (See pages 564-5, wherein a single variable is used and the equation is loaded with a value that controls production. The equation is solved);

performing a re-loading step which reloads components that were unloaded from an element in the loading step (See pages 564-5, wherein a single variable is used and the equation is loaded with another value that controls production. The equation is again solved);

merging elements that are further gated by components that were unloaded, with the loading, reloading, and merging steps resulting in an equilibrium configuration (See pages 564-5, wherein elements are merged and global maximums are solved. See also 568-9, which discusses unconstrained optimization); and

solving the equilibrium configuration to determine the optimization of the expected value function, wherein the solving is performed by a computer (See pages 564-5, wherein the optimal level is determined. See also 568-9, which discusses unconstrained optimization. See 606-7, which discusses software packages to solve the problem).

15. Claims 16-17 recite equivalent limitations to claims 3-4 and are therefore rejected using the same art and rationale applied above.

Art Unit: 3623

16. As per claim 18, Hillier et al. teaches the equilibrium configuration includes configuring of the plan into elemental blocks which are a function of a single variable (See pages 564-5, 569, 574-5, wherein the plan includes elemental blocks that are a function of a single variable).

17. As per claim 19, Hillier et al. teaches wherein the elemental block is maximized over this single variable (See pages 564-5, 569, 574-5, wherein the elemental block is maximized over a single variable).

18. As per claim 20, Hillier et al. discloses wherein the optimum level of components to support the maximization are derived from the maximized elemental values (See pages 564-5 and 568-9, wherein the optimums are derived).

19. As per claim 21, Hillier et al. teaches a method for optimizing the multivariate amount of refinements produced from a level of resources, the method comprising:

configuring the refinements and resources in a representative refinement space plan that accounts for connectivities therebetween (See pages 9-11, 13, 26-28, and 559, wherein a plan is formed associated with a non-linear EVF);

deriving a non-linear expected value function for the refinement space plan (See pages 559, 564-5, and 577-578, wherein a non-linear EVF is derived to model the plan);

converting the non-linear expected value function to a closed form expression (See pages 559 and 564-5, which discloses a non-linear expected value function that is converted to be solved);

transforming the refinement space plan into a working space plan, with the refinements represented by transformed elements (See pages 9-11, 13, 559, and 564-5, wherein the plan is transformed into a working model with the refinements represented in the elements);

sequentially loading each element with resources that gate production of the element (See pages 564-5, wherein a single variable is used and the equation is loaded with a value that controls production. The equation is solved);

sequentially re-loading components that were unloaded from elements in the loading step (See pages 564-5, wherein a single variable is used and the equation is loaded with another value that controls production. The equation is again solved);

merging elements that are further gated by components that were unloaded, with the loading, reloading, and merging steps resulting in an equilibrium configuration (See pages 564-5, wherein elements are merged and graphically depicted. See also 568-9); and

solving the equilibrium configuration to determine the optimization of the expected value function, wherein the solving is performed by a computer (See pages 564-5, wherein the optimal level is determined. See also 568-9, which discusses unconstrained optimization. See 606-7, which discusses software packages to solve the problem).

Claim Rejections - 35 USC § 103

20. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 11 and 13-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hillier et al. (*Introduction to Operations Research*).

21. As per claim 11, Hillier et al. discloses wherein the transforming step includes transforming and manipulating the function (See pages 559 and 564-5, which transforms the plan

Art Unit: 3623

in a working plan, wherein the products become working elements of the objective functions).

However, Hillier et al. does not expressly disclose using an inverse Cholesky transformation.

Hillier et al. discusses manipulating and solving the mathematical expressions representing resource allocation problems. Using an inverse Cholesky transformation to transform values and variables is well known in the art of matrix algebra and mathematics. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to use an inverse Cholesky transformation in the working transformed space of Hillier et al. in order to increase the efficiency of manipulating and solving the equations of Hillier et al. By more efficiently solving the equations, run time will be reduced thereby saving costs.

22. As per claims 13 and 14, Hillier et al. teaches a demand distribution including any multivariate demand distribution that is non-linear (See pages 559, 563-6, 570-1, which discloses non-linear demand distributions with non-linear objective functions). However, Hillier et al. does not expressly disclose the elliptical family of distributions or normal distributions.

Hillier et al. discusses manipulating and solving the mathematical expressions representing non-linear resource allocation problems. The elliptical family of distributions is well known in the art of mathematics and in non-linear distributions. Further, normal distributions are well known in the art of mathematics. Therefore, it would have been obvious to one of ordinary skill in the art at the time of the invention to include the elliptical family and normal distributions in the distributions of Hillier et al. in order to increase the ability of the tool to meet the needs of the user by adding mathematical features and techniques that are readily used in the word of mathematics.

Art Unit: 3623

23. Claim 15 recites equivalent limitations to claim 11 and is therefore rejected using the same art and rationale as set forth above.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Beth Van Doren whose telephone number is (571) 272-6737. The examiner can normally be reached on M-F, 8:30-5:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tariq Hafiz can be reached on (571) 272-6729. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
